

Kubernetes Administrator Course

ETCD Tasks

1. Using etcdctl (the command line client for etcd):
 - Write a key-value pair into the database.
 - Retrieve the value using the key.
 - Update the value for the given key.
 - Delete the key from the database.
 - Store a key-value pair with a Time-To-Live (TTL).
 - Check the database after the TTL has expired to confirm the key has been removed.
 - Store a key-value pair associated with a lease.
 - Revoke the lease and observe the behavior.
